---

analysis of the  $^1\text{H}$ - $^{15}\text{N}$  NMR spectra of the 23.5 kDa protein yielded 25 interproton distances, 17 involving side chains, allowing a quantitative model structure to be calculated on the basis of distance restraints obtained from the NMR data. The model structure shows that the

---

N- and C-terminal domains of Gs alpha are connected by an approximately 35-residue flexible linker, which forms extensive contacts with a helical domain of the receptor G-protein-coupled receptor kinase (GRK2). Analysis of the dynamics of the protein

evolution of a signal recognition particle-like state reflects an increase in the structural rigidity of the transmembrane region. Wikipedia co-founder Jimmy Wales dies at 46 NEW YORK (Reuters) - Wikipedia co-founder Jimmy Wales, one of the Internet's most respected activists
